

Support the Critical Care Research Group

The CCRG was founded in 2004, and is a multi-disciplinary team of clinicians, scientists and engineers. The CCRG is based in The Prince Charles Hospital—Australia's leading cardiothoracic hospital for more than 20 years.

The team strives to undertake innovative research to improve patient outcomes for those who find themselves in a critical condition. One of their major passions is finding solutions for cardiovascular disease, and they hope to improve the current situation through a number of focus areas:

- Developing & improving transplantation preservation technology (to keep hearts and lungs alive for longer outside of the body)
- Improving mechanical assist devices to take care of those who rely on this technology to survive
- Investigating the role of stem cell therapies in organ transplantation

The Prince Charles Hospital Foundation has supported several of CCRG's major research projects, and continue to offer them support for both their young and experienced researchers.
